

Bioinformatics 1

Biology, Sequences, Phylogenetics

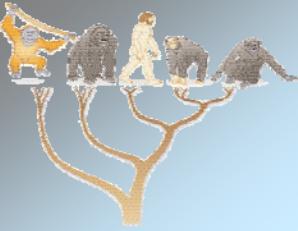

Part 1

Sepp Hochreiter

Master Bioinformatics

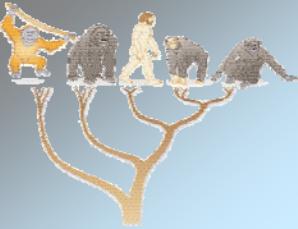

- 3 credits (plus 3 credits for exercises)
- first basic course: module M6 (required for other modules)

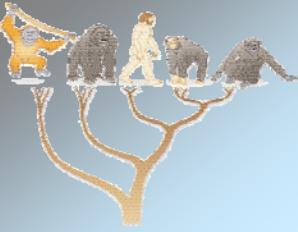

Biological Chemistry

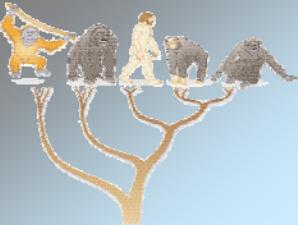

→ 2.6 credits (plus 3.2 credits for exercises)

→ Module “informatics”

- Examination at the end of the class
- Course manuscript:
<http://www.bioinf.jku.at/teaching/ws2010/bin1/>
- Also videos

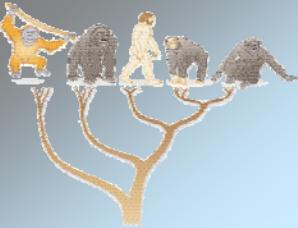

Schedule Master Bioinf 2010 1. Sem.

320007/320061
Molekulare
Biologie der
Zelle I

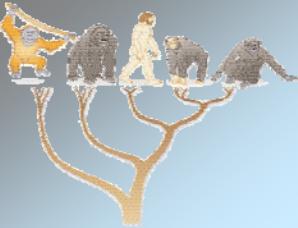

→
Meeting
Monday 4. Oct.
11:00
in front of the
elevator in the
10. Level of the
TNF tower

	Mon	Tue	Wed	Thur	Fri
08:30- 09:15				Alternative for 340023 (Monday) 326011 Algorithms and data structures 2KV	
09:15- 10:00					
10:15- 11:00	348408 Introduction I to Gen Chemistry 1VO		365027 Bioinformatics I 2UE		365046 Numerical and symbolical methods for Bioinformatics 2KV
11:00- 11:45				332056+332057 Statistical Signal Processing 2VO+2UE	
12:00- 12:45	344014 Artificial Intelligence 2VO				
12:45- 13:30					
13:45- 14:30	340023 Algorithms and Data Structures 2 2VO (Alternative: 326011, Thursday)	351001 Information Systems 1 2VO	347334 Chemistry for Physicist II 2VO	351003/35100 4 Information Systems 1 2UE	348408 Introduction I to General Chemistry 1VO
14:30- 15:15					
15:30- 16:15	365027 Bioinformatics I 2VO	347333 Introduction into instrumental analytics for Life- Sciences 3KV	347333 Introduction into instrumental analytics for Life-Sciences 3KV	351002/351005 Information Systems 1 2UE	
16:15- 17:00					

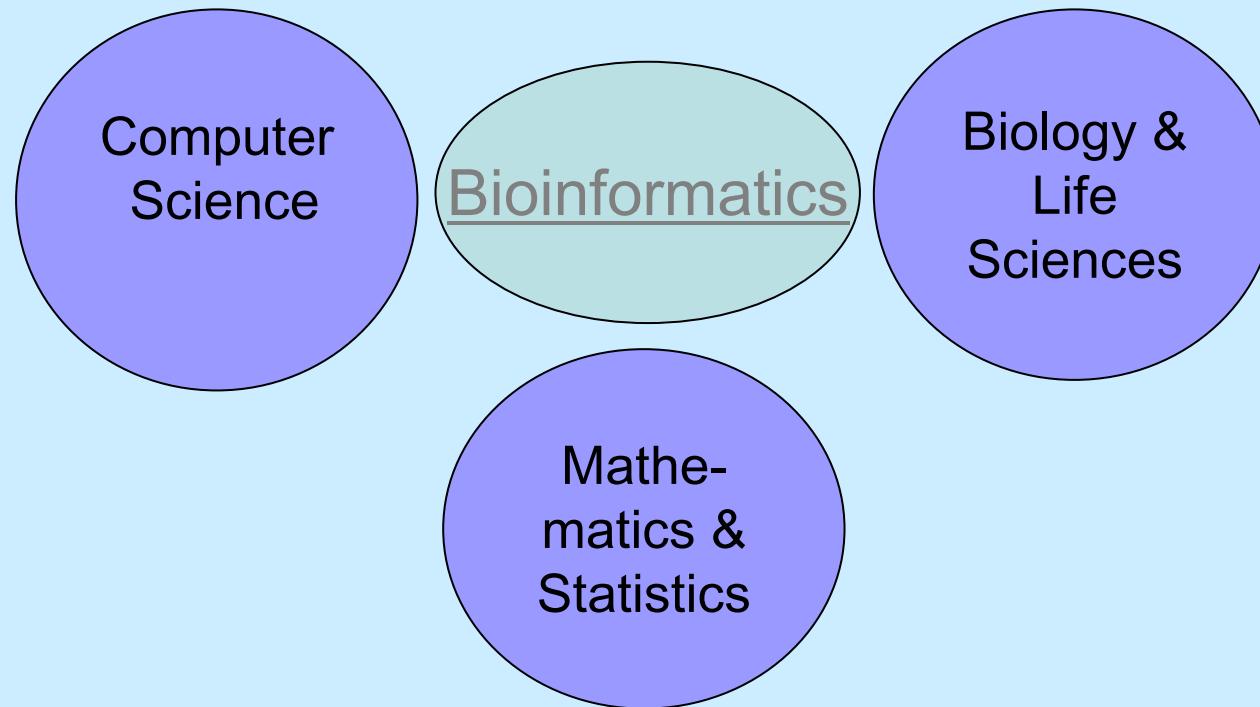

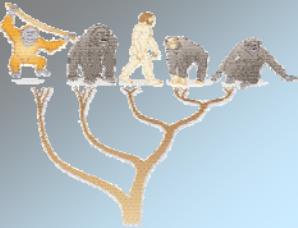

What is Bioinformatics?

- Interface of biology and computers
- Analysis of proteins, genes and genomes using computer algorithms and computer databases
- Analysis and storage of the billions of DNA base pairs that are sequenced by genomics projects

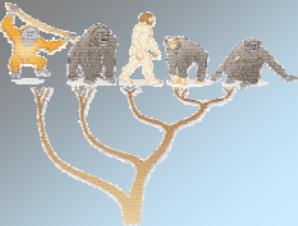

What is Bioinformatics?

What is Bioinformatics?

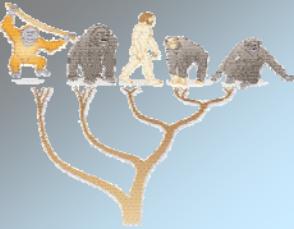

- “Bioinformatics is a new subject of genetic data collection, analysis and dissemination to the research community.”
Hwa A. Lim (1987)
- “*Bioinformatics*: Research, development, or application of computational tools and approaches for expanding the use of biological, medical, behavioral or health data, including those to acquire, store, organize, archive, analyze, or visualize such data.” *NIH working definition (2000)*

What is Bioinformatics?

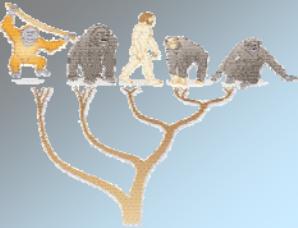

<http://en.wikipedia.org/wiki/Bioinformatics>

- creation and advancement of *databases*, algorithms, computational and statistical techniques, and theory to solve formal and practical problems arising from the *management* and analysis of biological data. → BI IV
- mapping and analyzing DNA and protein sequences, aligning different DNA and protein sequences to compare them and *creating and viewing 3-D models of protein structures*. → BI III
- focus on developing and applying computationally intensive techniques (e.g., *pattern recognition*, *data mining*, *machine learning algorithms*, and *visualization*) → BI II
- Major research efforts in the field include sequence alignment, *gene finding*, *genome assembly*, *protein structure alignment*, *protein structure prediction*, *prediction of gene expression* and *protein-protein interactions*, *genome-wide association studies* and *the modeling of evolution*. → BI III

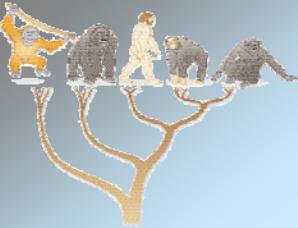

Questions Answered by Bioinformatics

- From where came the first human?
- Is Anna Anderson the tsar's daughter Anastasia?
- Are the neanderthals the ancestors of the humans?
- What are the evolutionary relationships between species

But did Africa leave Africa? With its own ancestor

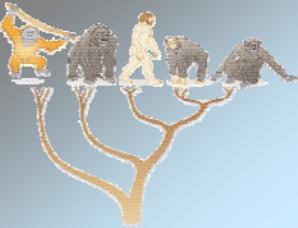

Is Anna Anderson the tsar's daughter Anastasia Romanov?

Anastasia (1909)
and
Anna Anderson (1959)

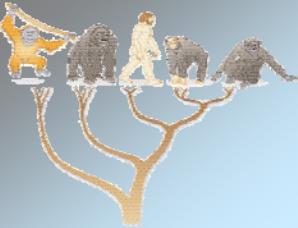

The kids of
the tsar

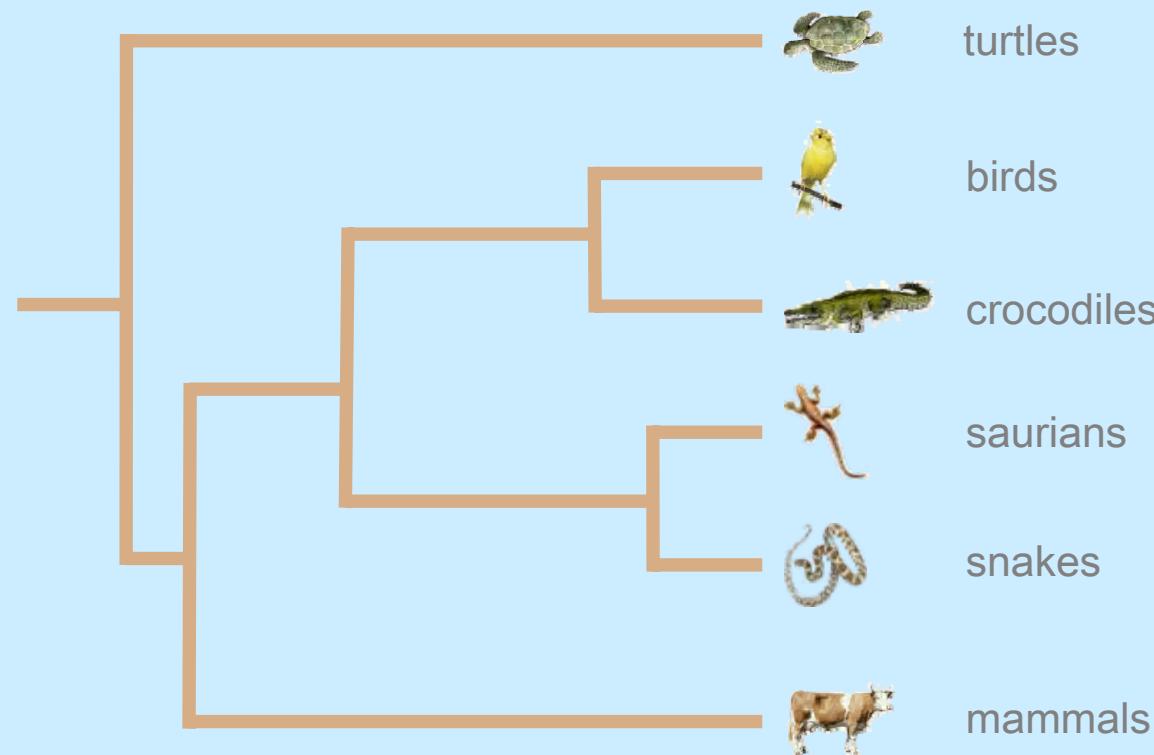

Are the neanderthals the human
ancestors or a different species?

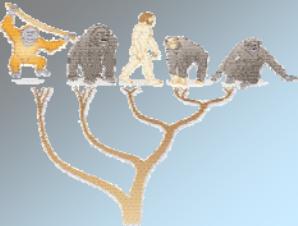

Phylogeny: history of species

Phylogenetic knowledge: evolutionary trees

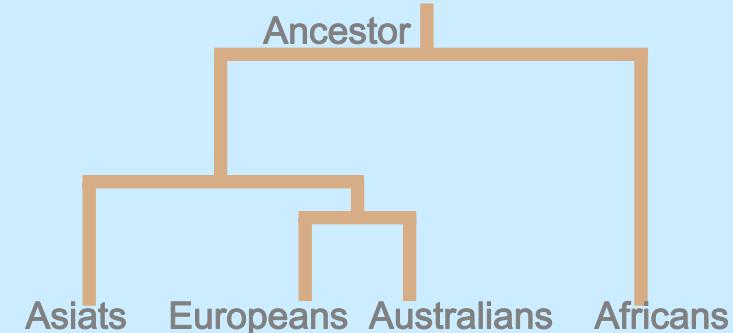

Three Answers

→ From where came the first human?

Africa!

→ Is Anna Anderson the tsar's daughter Anastasia?

No!

Anna Anderson

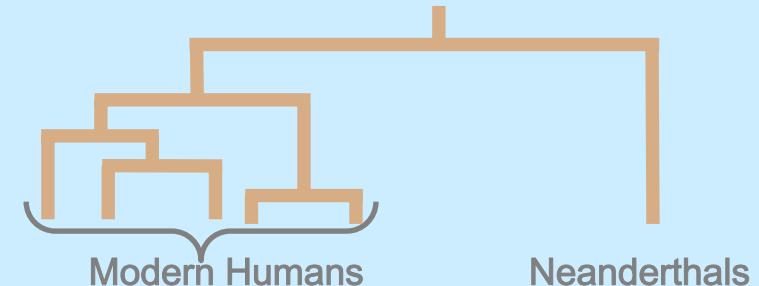

Carl Maucher (Grand nephew
F. Schanzkowska)

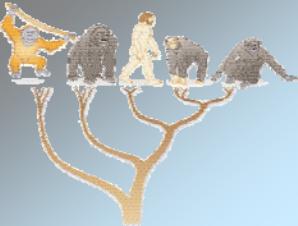

Prince Philip (Grand nephew zar)

91	106	324	337
CCACCATGAATATTGC	CCACCATGAATATTGC	TAGTCAAATCCCTT	TAGTCAAATCCCTT
TCACCATGAATATTGT		CAGTCAAATCCCTC	

→ Are the neanderthals the ancestors of the humans?

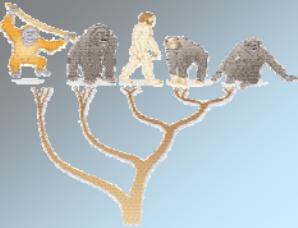

No! Separate Species

1.9 Translation

1.9.1 Initiation

1.9.2 Elongation

1.9.3 Termination

1.10 Folding

- **nucleus:** eukaryotes only - a cell's information center → chromosomes, DNA
- **nucleolus:** ribosome subunits assembly
- **mitochondria and chloroplasts:** the power generators (oxidative phosphorylation, photosynthesis); contain their own genome from mother
- **endoplasmic reticulum (ER)** – eukaryotes only : transport network for certain modifications and specific destinations; the rough ER, which has ribosomes on its surface and secretes proteins into the cytoplasm
- **golgi apparatus** – eukaryotes only : process and package macromolecules; vesicles
- **ribosomes:** RNA/protein complex that synthesizes proteins from mRNA
- **lysosomes:** enzymes (acid hydrolases) that digest old organelles, food particles, and engulfed viruses or bacteria
- **peroxisomes:** rid the cell of toxic peroxides
- **centrosome:** cytoskeleton, microtubules for directing the transport through ER and golgi apparatus
- **vacuoles:** store food and waste.

How are the nano-machines in the cell constructed?

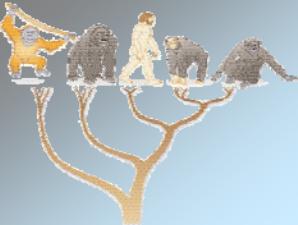

→ These machines are proteins or protein-RNA complexes

Where is the information about these machines stored?

→ Everything is stored in the DNA

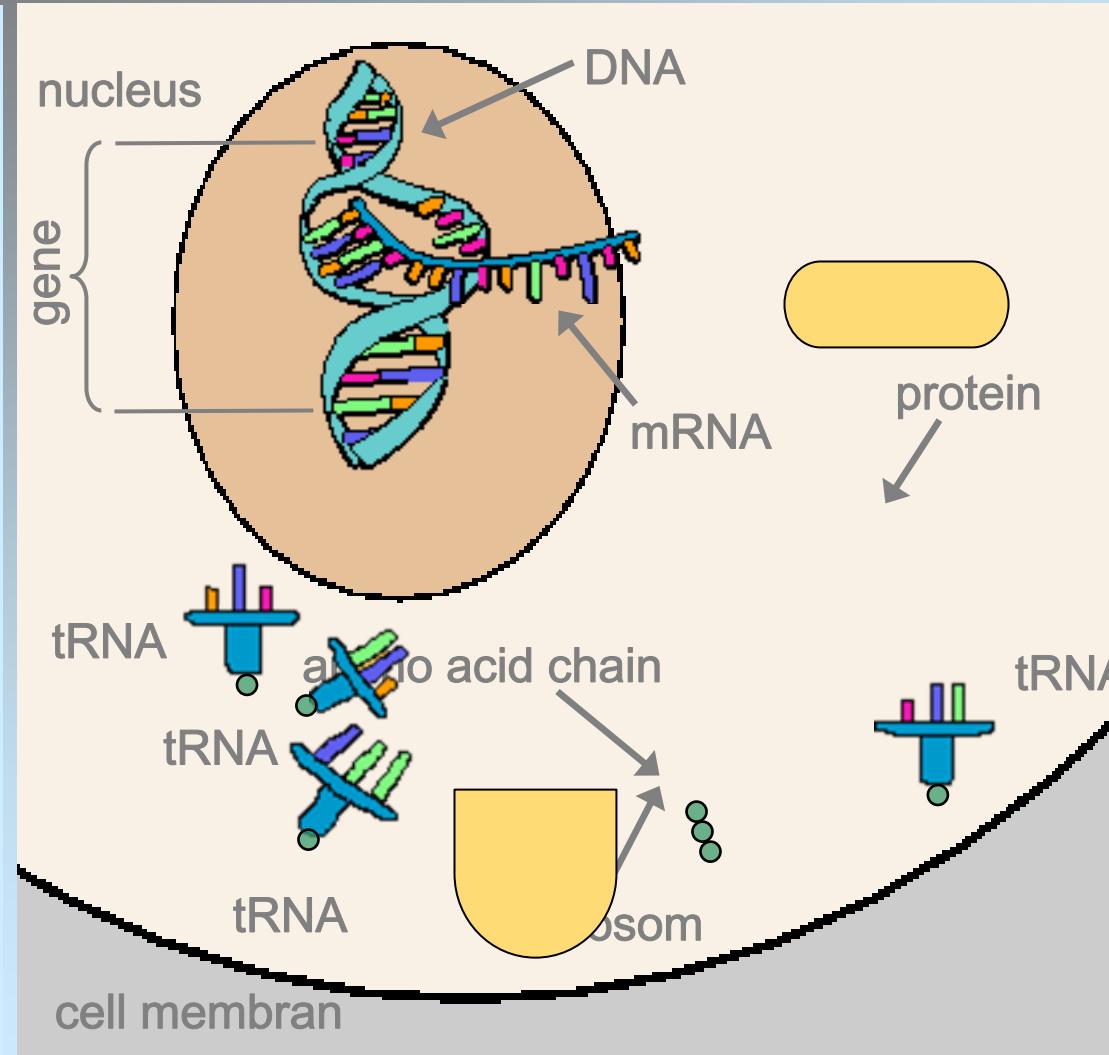

How is the information in the DNA used to build proteins?

→ Central dogma: DNA → RNA → Proteins

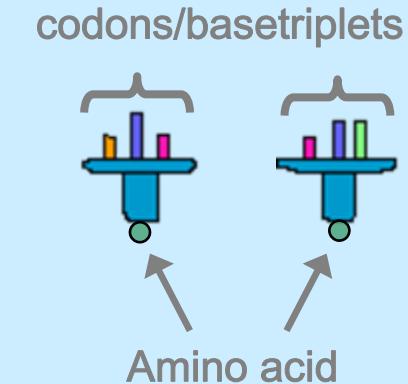

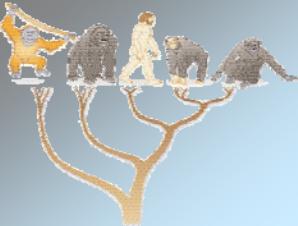

Central Dogma

Deoxyribonucleic acid (DNA) codes all information of life

→ double helix as sequence of nucleotides with a deoxyribose

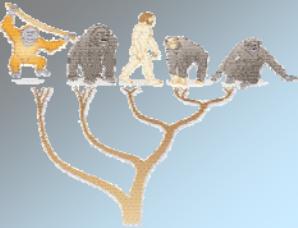

→ ends are called 5' and 3'; DNA is written from 5' to 3'

→ upstream is towards the 5' end downstream towards the 3'

→ 5 nucleotides (nucleobases, bases): adenine (A), thymine (T), cytosine (C), guanine (G), and uracil (U)

→ first 4 in DNA whereas uracil in RNA instead of thymine

→ two classes: purines (A, G) / pyrimidines (C, U, T)

1.10 Folding

- Single DNA nucleotides differ at each human
- Small differences are inherited from both parents (except maternal mitochondrial DNA)
- Variation in the DNA at the same position in at least 1% of the population: single nucleotide polymorphism (SNP -- pronounced snip)
- SNPs occur all 100 to 300 base pairs
- Current research relate diseases to SNPs (schizophrenia or alcohol dependence).

→ Ribonucleic acid (RNA): sequence of nucleotides

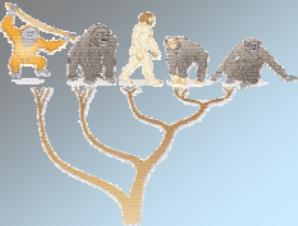

→ Contrast to DNA: ribose rings instead of deoxyribose; uracil instead of thymine

→ transcribed from DNA through RNA polymerases

→ kind of RNA:

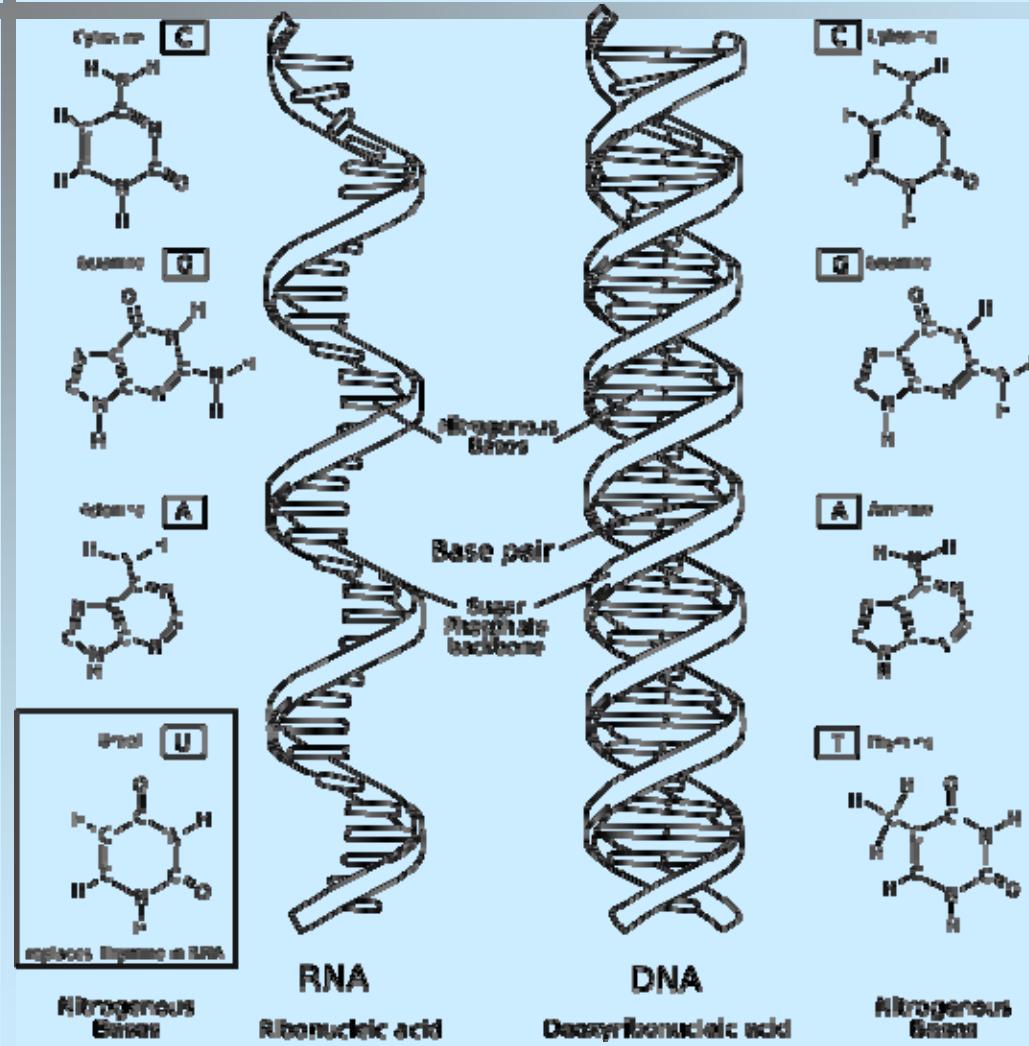

mRNA (messenger),
dsRNA (double stranded),
RNAi (interference),
ncRNA (non-coding) like

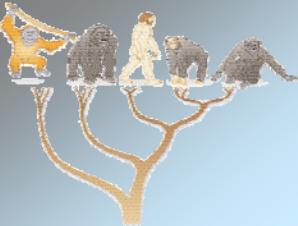

tRNA (codon coding),
miRNA (micro),
siRNA (small interfering),
rRNA (ribosomal)

- Splicing modifies pre-mRNA released after transcription
- Non-coding sequences: introns (intragenic regions)
- coding sequences: exons are glued together
- A snRNA complex, the spliceosome, performs the splicing but some RNA sequences can perform autonomous splicing

→ pre-mRNA can be spliced in different ways: alternative splicing, therefore a gene can code different proteins

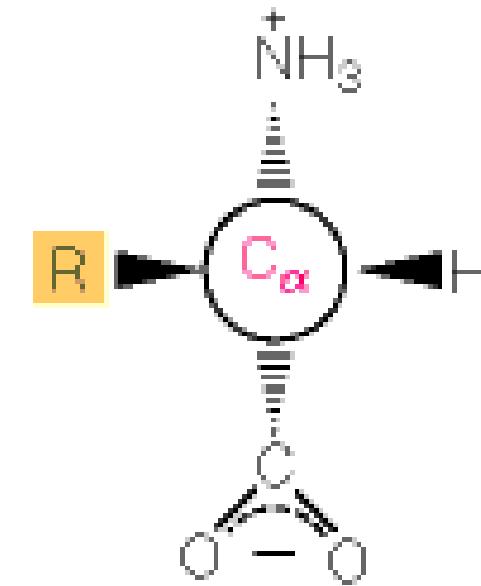

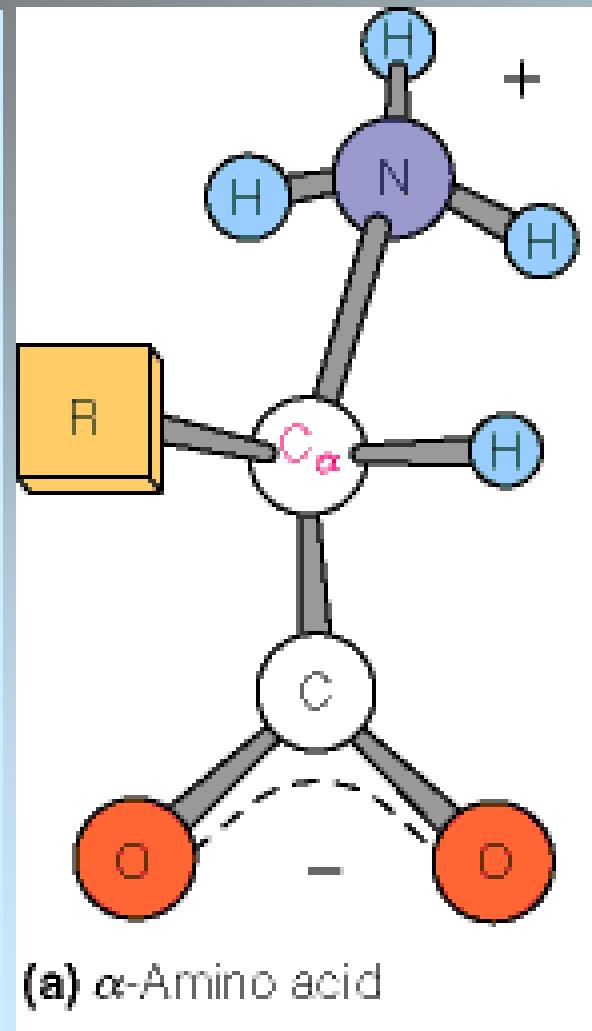

→ Alternative splicing is controlled by signalling molecules

1.10 Folding

- all proteins consist of these 20 amino acids
- 3D interactions of the amino acids results in nano-machines
- genetic code: instructions for producing proteins from DNA
- protein is coded through a gene which is transcribed into mRNA and then translated into an amino acid sequence which automatically configures into a protein
- genetic code gives the rules for translation
- rules are simple: 3 nucleotides (codon) = one amino acid
AUG and CUG: start codon

1.9.2 Elongation

1.9.3 Termination

1.10 Folding

After transcription the pre-mRNA is spliced, edited, transported out of the nucleus into the cytosol (eukaryotes)

→ The ribosome (protein production machinery) assembles the amino acid sequences out of the mRNA

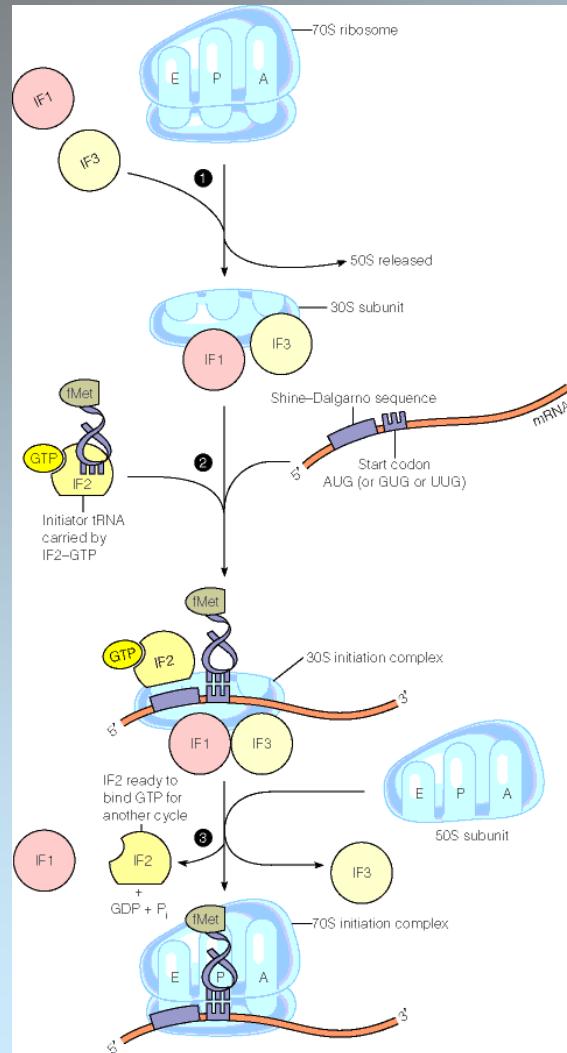

→ Ribosome consists of two subunits 60S and 40S in eukaryotes and 50S and 30S in bacteria

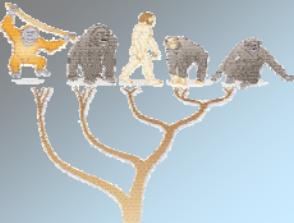

Translation Initiation

- 1 Biological Basics
- 1.1 The Cell
- 1.2 Central Dogma
- 1.3 DNA
- 1.4 RNA
- 1.5 Transcription
- 1.5.1 Initiation
- 1.5.2 Elongation
- 1.5.3 Termination
- 1.6 Splicing
- 1.7 Amino Acids
- 1.8 Genetic Code
- 1.9 Translation
- 1.9.1 Initiation**
- 1.9.2 Elongation
- 1.9.3 Termination
- 1.10 Folding

- Inactive ribosomes have dissociated subunits
- Ribosome binds to site at mRNA marked by AGGAGGU (Shine-Dalgarno)
- At this site the initiation factors IF1, IF2, IF3 and 30S ribosomal subunit bind
- The initiator tRNA binds to the start codon
- Then the 50S subunit binds to the complex and translation can start

Translation Elongation

1.7 Amino Acids

1.8 Genetic Code

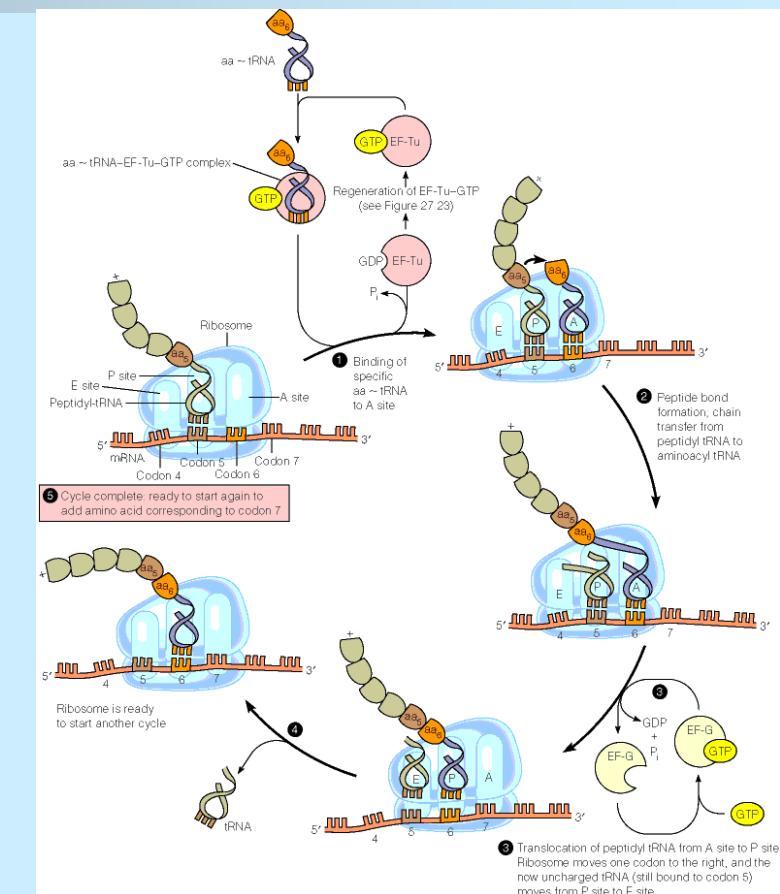

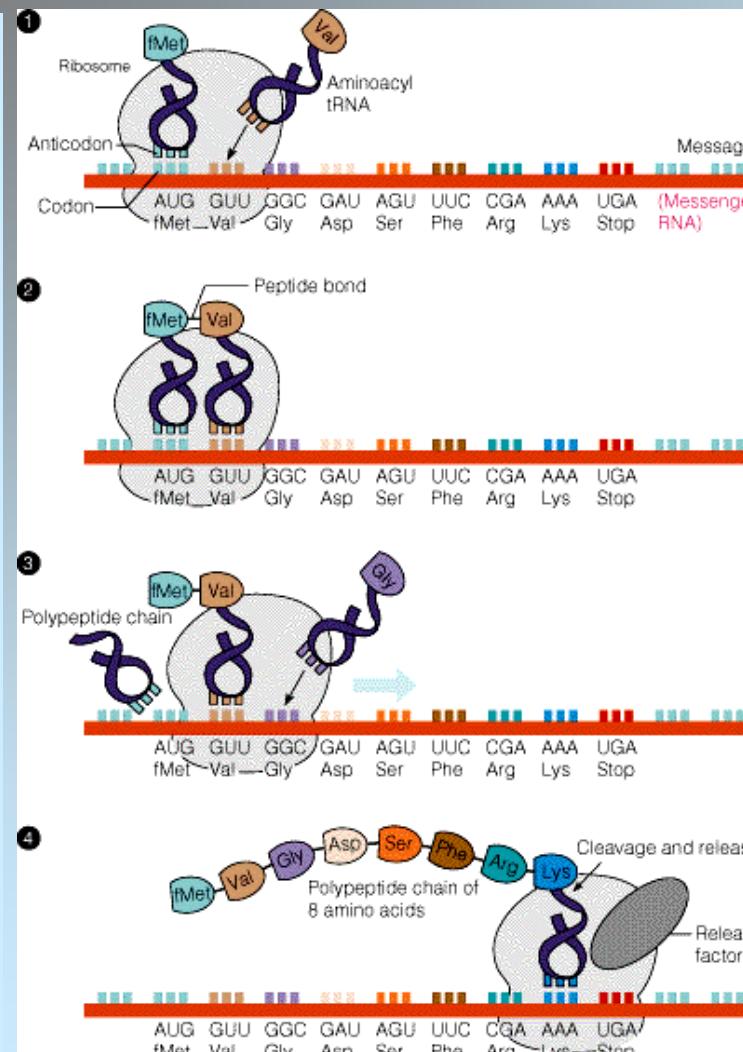

1.9 Translation

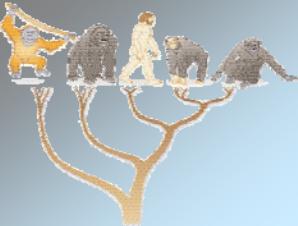

1.9.1 Initiation

1.9.2 Elongation

1.9.3 Termination

1.10 Folding

- Termination by a stop codon (UAA, UAG, UGA) which enters the A-site
- tRNAs cannot bind, however release factors bind at or near
- amino acid chain is released and the 70S ribosome dissociates
- 30S subunit remains attached to the mRNA and searching for the next Shine-Dalgarno pattern

Translation Termination

1.9.3 Termination

1.10 Folding

- Only the correct folded protein functions correctly (cf Creutzfeld-Jacob, Alzheimer, BSE, Parkinson)
- proteins always fold into their specific 3D structure
- complicated procedure with lots of interactions
- folding pathways are not unique and have intermediate states
- folding is assisted by special chaperones (hide the hydrophobic regions or act as containers)
- Folding time: milliseconds up to minutes or hours
- major tasks in bioinformatics is the prediction of the 3D structure to guess the function or to design new proteins
